

# **Intracellular/Surface Moonlighting Proteins**

BY

WANGFEI WANG  
B.S., Jiangnan University, 2011

THESIS

Submitted as partial fulfillment of the requirements  
for the degree of Master of Science in Bioengineering  
in the Graduate College of the  
University of Illinois at Chicago, 2015

Chicago, Illinois

Defense Committee:

Dr. Constance Jeffery, Chair and Advisor  
Dr. Ao Ma  
Dr. Fatemeh Khalili-Araghi, Department of Physics

I dedicate my dissertation work to my family, especially to my parents, Xiaowen and Minxue who have supported and encouraged me all the time even while they are in China. A special gratitude to all my cousins, for taking care of my parents and never making them feel lonely.

I also dedicate this dissertation to my friends, who have been there with me. I appreciate my friend, Mingliang Ding, for giving me valuable thoughts about my project, and my best friend, Tianjiao Chen, for these years' encouragement.

Finally, I would also like to give special thanks to my friend, Martin Brennan, who has accompanied me and supported me throughout my project. I will always appreciate all he has done.

## ACKNOWLEDGMENTS

I would like to acknowledge my thesis committee, Dr. Jeffery, Dr. Ma and Dr. Khalili for their unwavering help, support and guidance. I appreciate their time and efforts on my thesis. A very special thanks to my advisor Dr. Jeffery for the support she's lent me over these years. Without her guidance in all areas, I would not have finished my thesis work and accomplished my research goals.

I would also like to express my sincere thanks to my lab mates Chang Chen and Haipeng Liu in Jeffery's Lab. I would like to acknowledge former lab members for gathering data and establishing the MoonProt Database. Finally, I would like to thank the undergraduates in Jeffery's Lab, Michael Chen, Ahlam Shaab, and Shivani Patel for helping me collecting data from journal articles describing proteomics projects.

PDB	Protein Data Bank
PGM	Phosphoglycerate Mutase
PspA	Pneumococcal Surface Protein A
TMBs	Transmembrane Beta-barrels
TMHs	Transmembrane Alpha-helices
TPI	Triosephosphate Isomerase
T1SS to T6SS	Type I-VI Secretion Systems
UniProtKB	Universal Protein Resource Knowledgebase

## SUMMARY

Bacterial surface proteins play an important role in bacterial infection and virulence. More and more intracellular proteins have been found also to be located on the cell surface where they perform a second function. The intracellular proteins that perform a second function on the cell surface were defined as intracellular/surface moonlighting proteins in this work. These proteins have been commonly identified in cell surface proteomes or cell wall proteomes in proteomics studies. Published proteomics studies were used to collect information about proteins found on the cell surface in this work. Protein sequences were obtained from UniProtKB and NCBI databases and were then analyzed by bioinformatics tools. I found that more than 1,100 out of the 3,027 proteins that were found to be located on the cell surface through proteomics studies lack transmembrane alpha-helices, transmembrane beta-barrels and signal peptides for secretion. Many of these proteins are chaperones and proteins involved in carbohydrate metabolism and biogenesis.

This work shows that the presence of intracellular proteins on the cell surface is more common than previously expected. This large number of examples of intracellular/cell surface proteins will help scientists and researchers to learn more about the role the intracellular/surface moonlighting proteins play in bacterial infection and virulence. Additional information about proteins located on the cell surface can also be important in developing new vaccine or biomarkers.

## I. INTRODUCTION

### **A. Moonlighting Proteins**

Moonlighting proteins are a subset of multifunctional proteins in which the multiple functions are not due to gene fusions, families of homologous proteins, promiscuous enzyme activity or splice variants [1]–[3]. Also, proteins that have the same functions in different cell types are not counted as moonlighting proteins [3].

To date, around 300 moonlighting proteins have been identified [4]. More moonlighting proteins are likely to be found in the future. In terms of functions, many of the identified moonlighting proteins are receptors (e.g., Neuropilin, which is a VEGF receptor in endothelial cells but the receptor for semaphorin III in nerve axons [5]), metabolic enzymes (e.g., phosphoglucose isomerase is a glycolytic enzyme and also a neurotrophic factor, an autocrine motility factor and a differentiation and maturation mediator [6], [7]), chaperones (e.g., some ATP-dependent proteases, including Clp and FtsH in bacteria also act as chaperones [8]), ribosomal proteins (e.g., *E. coli* ribosomal protein S1 is also a subunit of the replicase of RNA phages [9]) and transmembrane channels (e.g., cystic fibrosis transmembrane-conductance regulator is a chloride channel and a regulator of the ENaC channel [10]).

### **B. Intracellular/Surface Moonlighting Proteins**

Moonlighting proteins may perform different functions as a result of different localization in a cell, expression in different cell types, different oligomeric states, or changes in the cellular concentrations of a ligand, cofactor, substrate or product [1]. My

project is focused on proteins that have both functions inside the cell and on the cell surface. I will refer to these proteins as intracellular/surface moonlighting proteins.

### **1. Roles of Intracellular Proteins on the Cell Surface**

After the first discovery of a glycolytic enzyme, glyceraldehyde-3-phosphate dehydrogenase (GAPDH), on the surface of group A streptococci [11], [12], a lot of research has been done on the multiple functions of GAPDH found on the surfaces of several species of bacteria. On the cell surface, GAPDH can moonlight as an adhesin for cell binding in *Streptococcus suis* serotype 2 [13]. In *S. pyogenes*, GAPDH is a cell surface receptor for plasminogen [11], [14]. GAPDH has also been found to have multiple functions in other organisms. In gram-negative bacteria such as *E. coli*, GAPDH has been found to be secreted outside the cell where it plays a role in signal transduction [15]. Besides GAPDH, other cytoplasmic enzymes in glycolysis, such as enolase/phosphopyruvate hydratase, also moonlight on the cell surface. In *Lactobacillus plantarum*, surface located enolase has the ability to bind fibronectin, a major host component of the ECM [16]. In some group A *Streptococci* species, streptococcal surface enolase (SEN) also serves as a plasminogen-binding protein [17].

Glycolytic enzymes are not the only group of intracellular proteins that have been found to play a second role on the cell surface. In addition to playing a critical role in protein folding, some chaperones can be released onto the cell surface. Hsp70/DnaK from *Bifidobacterium* is a chaperone, generally thought to be intracellular, but it was also observed to be surface exposed by transmission electron microscopy and showed high

affinity to human plasminogen [18]. *Legionella pneumophila* Hsp 60/GroEL was identified as an adhesin and was shown to promote binding of this pathogenic bacterium to HeLa cells by which it can mediate invasion [19]. More examples of intracellular/surface moonlighting proteins are listed in Table 1.

Intracellular/surface moonlighting proteins not only exist in bacteria, but also in fungi, protozoan parasites and mammalian cells. For instance, Hsp 60/GroEL is displayed on the cell surface of eukaryotic Caco-2 cells and acts as host cell receptor for the *Listeria* adhesion protein (LAP) in the pathogen *Listeria monocytogenes* [20]. Hsp60 has been identified by internal microprotein sequencing to be the cell surface binding protein for HDL in human cell lines. Other examples are shown in Table 2. But in this project, we focus on the bacterial intracellular/surface moonlighting proteins in bacteria.

Table 1. Examples of previously identified bacterial intracellular/surface moonlighting proteins in the literature

Intracellular function	Surface function	Species	Gram type
6-phosphofructokinase	Binds plasminogen	<i>Streptococcus oralis</i> [21]	Positive
Enolase	Binds plasminogen and laminin	<i>Bacillus anthracis</i> [22]	Positive
GAPDH, Elongation factor Tu (EF-Tu) and triosephosphate isomerase (TPI)	Bind Caco-2 cells	<i>Lactobacillus plantarum</i> [23]	Positive
EF-Tu and GroEL	Adhere to mucin and human epithelial cells	<i>Lactobacillus Johnsonii</i> [24], [25]	Positive
Hsp60, GroEL	Adheres to eukaryotic host cells, binds glycosphingolipids	<i>Haemophilus ducreyi</i> [26], [27]	Negative
Hsp60, GroEL	Cell surface protein controlling bacterial growth	<i>Helicobacter pylori</i> [28]	Negative
Hsp60, GroEL	Cell adhesion	<i>Chlamydia pneumoniae</i> [29]	Negative
Hsp65, GroEL2	Cell surface protein that inhibits bacterial association with macrophages	<i>Mycobacterium tuberculosis</i> [30]	Acid-fast Gram-positive bacterium
Peroxiredoxin, DnaK and enolase	Bind plasminogen	<i>Neisseria meningitides</i> [31]	Negative
Ornithine carbamoyltransferase	Binds fibronectin	<i>Staphylococcus epidermidis</i> [32]	Positive
Glucosyltransferase	Adhesin to human endothelial cells	<i>Streptococcus gordonii</i> [33]	Positive
Malate synthase	Binds fibronectin and laminin	<i>Mycobacterium tuberculosis</i> [34]	Acid-fast Gram-positive bacterium
Glutamine synthetase	Binds laminin, fibronectin, collagen I, plasminogen	<i>Lactobacillus crispatus</i> [35]	Positive
TPI	Adhesion to fungal pathogen	<i>Staphylococcus aureus</i> [36]	Positive
Pyruvate kinase	Recognizes and binds to yeast mannan	<i>Lactococcus lactis</i> [37]	Positive

Table 2. Examples of intracellular/surface moonlighting proteins in non-bacterial species

Intracellular function	Surface function	Species	Kind of species
TPI	Binds laminin	<i>Candida albicans</i> [38]	Fungus
Enolase	Binds plasminogen	<i>Pneumocystis carinii</i> [39]	Fungus
GAPDH	Binds fibronectin and laminin	<i>Candida albicans</i> [40]	Fungus
Peroxisomal catalase	Binds plasminogen	<i>Candida albicans</i> [41]	Fungus
NADP <sup>+</sup> dependent malic enzyme	Adheres to erythrocytes and HeLa cells	<i>Trichomonas vaginalis</i> [42]	Protozoan parasite
Alcohol dehydrogenase	Binds fibronectin and laminin	<i>Entamoeba histolytica</i> [43]	Protozoan parasite
GAPDH	Binds fibronectin, plasminogen and collagen	<i>Trichomonas vaginalis</i> [44]	Protozoan parasite

The examples of intracellular/surface moonlighting proteins are by no means limited to the proteins listed above, but these examples prove that the presence of intracellular proteins at “unexpected” locations is not always because of coincidence or experimental artifacts. Some intracellular proteins in pathogenic bacteria, fungi and protozoa have the ability to get secreted onto the cell surface and interact with plasminogen and host components in the extracellular matrix (ECM), such as fibronectin and laminin [45] (Figure 1). This interaction enables pathogens to colonize host tissues and plays an essential role in infection and virulence [45].

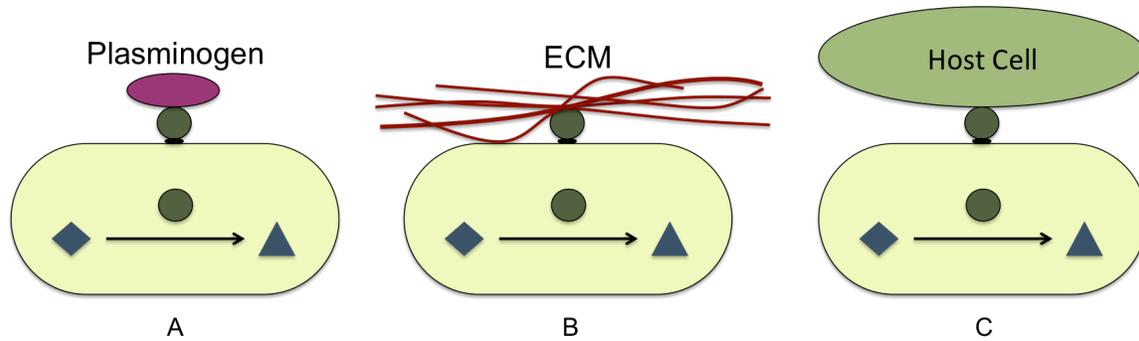

Figure 1. Intracellular proteins that perform another function on the cell surface. An intracellular/surface moonlighting protein can function as an enzyme inside of the cell, converting a substrate (diamond) to a product (triangle) (A-C) and can also present on the cell surface. Some of them can bind to plasminogen and convert plasminogen to plasmin (A), or bind to extracellular matrix (such as fibronectin, collagen and laminin), or interact with host cell surface proteins (C). These intracellular proteins on the cell surface often play an important role in invasion, infection and virulence.

## **2. Protein Secretion and Secretory Pathways**

The correct subcellular localization is important for proteins to function properly. More than a third of all proteins synthesized in the cytoplasm need to be transported across the cell membrane upon synthesis to function as toxins, adhesins, invasins or for other roles [46]. Most secreted proteins are co-translationally transported across a membrane. These secreted pre-proteins carry a signal peptide at the N-terminus that can be recognized by the translocation system. For secreted proteins, the signal peptide is cleaved when the protein is translocated through the cell membrane.

Gram-negative bacteria have an inner plasma membrane as well as an outer membrane. This architecture requires secreted proteins to be transported through the inner membrane, periplasmic space and finally the outer membrane. So far, at least six

types of secretory pathways have been found in Gram-negative bacteria, named the type I-VI secretion systems (T1SS to T6SS). They can be classified as Sec dependent and Sec independent pathways. The Sec dependent secretion system generally relies on a signal peptide on the protein's N-terminus that leads to co-translational transport of proteins across the inner membrane to the periplasm [47]. In the Sec independent pathways, such as the type I secretion system (T1SS), also known as an ABC protein exporter-mediated secretion system, the secreted proteins are directed toward the secretory pathway because of a C-terminal secretion signal [48]. In an alternative Sec independent secretion system, the twin-arginine translocation pathway (Tat), the secreted proteins are targeted to the secretion pathway with highly conserved Tat signal peptides in a folded manner [49]. These secretory pathways transport secreted proteins across the inner membrane, other secretory systems are needed for the export across the outer membrane.

Unlike for Gram-negative bacteria, the protein secretory mechanisms in Gram-positive bacteria are less well understood. Gram-positive bacteria only have a single membrane with a thick peptidoglycan layer in the cell wall. In the signal peptide-mediated secretion system, the signal peptide directly leads secreted proteins from the cytoplasm into the extracellular environment. Some pre-proteins have a signal peptide at the N-terminus and a sorting signal at the C-terminus that can be recognized and cleaved by sortase. This latter process leads the attachment of these proteins to the cell wall.

However, some intracellular proteins without known signal peptides have also been found to be secreted [50]. This behavior, first discovered and identified in

eukaryotes, is defined as non-classical secretion [50]–[52]. The *Mycobacterium tuberculosis* glutamine synthetase was the first published intracellular protein to be observed to be secreted in the absence of a signal peptide in bacteria. Harth et al. [53] studied the targeting of recombinant *M. tuberculosis* glutamine synthetase in *M. smegmatis*. Glutamine synthetase lacks a signal peptide and was originally believed to be solely intracellular, but it was found that it can be secreted in pathogenic *M. tuberculosis*, but not in the non-pathogenic species *M. smegmatis*. Surprisingly, the recombinant *M. tuberculosis* glutamine synthetase is released extracellularly when expressed in *M. smegmatis*, even more efficiently than in *M. tuberculosis*. This result indicates that the protein is released with a novel signal peptide independent secretion pathway, and the release signal is within the amino acid sequences of the protein itself.

More and more intracellular proteins have been recently found to be secreted, but the mechanism of non-classical secretion is unknown. One hypothesis is that the proteins are released by cell lysis or cell death, supported by evidence such as the amount of GAPDH presence on the cell surface and in the supernatant were both impaired under conditions of low levels of cell lysis in group B Streptococcus [54]. However, many more studies showed that most of these cytoplasmic proteins are secreted from an intact cell instead of simply being released due to cell lysis. Dreisbach et al. [55] measured cell integrity using TrxA as an intracellular marker and discovered highly variable proteins on the cell surface of *S. aureus*, including a lot of predicted intracellular proteins. Katakura et al. [37] measured a negligible amount of lactate dehydrogenase (0.006 units/ml) in the cell supernatant and more than 1,000 times that amount of lactate dehydrogenase when

the cell suspension was treated with sonication, showing that the presence of intracellular proteins such as DnaK and GroEL on the *Lactococcus lactis* surface was not the result of cell leakage. Other groups found a discrepancy in the amount of abundant proteins in the cytoplasmic fraction and in the cell wall fraction using 2-D gel electrophoresis.

Boonjakuakul et al. [56] isolated cell membranes and identified the proteins in different subcellular fractions. The major protein spots in the cytoplasmic fraction on the gel are very different from the prominent bands in the outer membrane fraction. There are many of these intracellular/surface proteins that are somehow secreted from the cell and are not simply released from the cell due to cell lysis.

The secretion pathways that make use of a signal peptide, such as Sec dependent and Tat secretion pathways, cannot explain the non-classical secretion behavior of intracellular proteins. Some potential pathways have been proposed, yet the underlying mechanisms are still unknown. EAST-6 and CFP-10, two small proteins secreted by *M. tuberculosis*, lack signal peptides [57]. Pallen [57] used PSI-BLAST to identify many proteins containing homology with EAST-6's amino acid sequence and found that the small antigenic proteins apparently secreted by the same system as EAST-6 share a WXG motif but lack a signal peptide, suggesting a possible novel Gram-positive secretion pathway.

Another example of a non-classical secretion pathway is the SecA2 system. This accessory Sec system has been identified in several Gram-positive bacterial species. Braunstein and coworkers [58], [59] compared secreted proteins in wild-type and secA2

mutant *M. tuberculosis* and found three proteins including SodA that lack a signal peptide but still get secreted from the cytoplasm in a SecA2-dependent manner. It is interesting that two of the identified SecA2 dependent lipoproteins in *M. smegmatis* still possess a signal peptide [60]. In *L. monocytogenes*, SecA2-dependent proteins can also be classified into two categories —proteins with a signal peptide and without a signal peptide [59], [61]. It remains a question as to why the SecA2 secretion system can export proteins both with and without a signal peptide out of the cytoplasm.

Despite the fact that Gram-negative secretion pathways have been more intensively investigated, fewer proteins have been identified that are secreted in a non-classical manner in Gram-negative bacteria than in Gram-positive bacteria. T3SS is a Sec independent pathway responsible for export of various proteins in many gram-negative pathogens. Aguilera and coworkers [62] first reported the export of the housekeeping protein GAPDH through T3SS in enteropathogenic *E. coli* (EPEC) and the interaction between GAPDH and CesT, the general chaperone of this secretion system. But more effort is needed to investigate why GAPDH can only be secreted in pathogenic *E. coli* strains like EPEC and enterohemorrhagic *E. coli* (EHEC), but not in non-pathogenic *E. coli* strains. Before Aguilera's report, Egea and coworkers [63] demonstrated that the medium condition is a key factor for GAPDH secretion by EPEC. This result shows that there are several secretion pathways for GAPDH in *E. coli*, and it points to the complexity of secretion pathways in Gram-negative bacteria. There is no doubt that non-classical secretion pathways in Gram-negative bacteria may be more complicated and require more attention.

### **3. Cell Surface Anchor Mechanisms**

Pathogenic bacteria start bacterial infections by colonizing host tissues. These organisms have evolved adhesion and attachment mechanisms to interact with host tissues. A lot of surface proteins act as adhesins, which are the bacterial ligands that interact with host cell receptors, and invasins, which are produced by bacteria to promote their penetration into host cells. After secretion of these proteins by Gram-positive bacteria, they become anchored to the surface of the bacterial cells with several mechanisms.

Some pre-proteins in Gram-positive bacteria, including bacilli, listeria and staphylococci, harbor a signal peptide at the N-terminus and a sorting signal, the LPXTG motif, at the C-terminus [64]. These pre-proteins are targeted to the secretion pathway via the signal peptide and become anchored to the cell wall after the cleavage of the LPXTG sorting signal by sortase A in these bacteria, albeit the cleavage mechanisms are different in different species [65]. In addition to *isdA* and *isdB* that encode proteins with the LPXTG motif, *S. aureus* has an *isdC* locus that codes a protein with an NPQTN sorting signal at the C-terminus that can be recognized and cleaved by sortase B, thus anchoring the protein to murein [66]. The whole *isd* cluster helps the import of haem and liberates iron for the growth of *S. aureus* [65], [66]. Other species also have sortase B homologues, but the mechanisms are somewhat different; for example, sortase B anchors proteins with an NPKTG instead of NPQTN sorting signal on the *B. anthracis* cell wall [67]. There are other major anchor mechanisms in Gram-positive bacteria, including pilus assembly and the sortase C anchoring mechanism [65]. A different anchor mechanism was found in *S. pneumoniae*. PspA has a N-terminal signal peptide and C-terminal choline-binding

repeats, anchoring to the cell surface via a choline-mediated interaction [64], [68].

Almost all of these systems share a common character that the proteins get secreted through use of signal peptides at the N-terminus and then anchored on cell wall via a motif at the C-terminus.

Accompanied by the discovery of more and more non-classically secreted proteins, it has been found that some surface proteins perform their functions on the cell surface without LPXTG or NPKTG motifs or choline-binding repeats, suggesting an “anchorless” mechanism [64]. Pancholi and Fischetti [12] identified a 45 kDa surface protein with strong plasminogen binding activity as the streptococcal surface  $\alpha$ -enolase (SEN). They further confirmed the importance of a SEN C-terminal lysine residue and an N-terminal region in performing its plasminogen-binding role. Bergmann and coworkers [69] characterized a 47 kDa surface protein in *S. pneumonia* as  $\alpha$ -enolase, which shares 93% sequence identity to the sequence of SEN. This  $\alpha$ -enolase gets secreted in an unknown non-classical secretion pathway and is able to reassociate to the pneumococcal cell surface, as confirmed by electron microscopy [69]. The lysine residue at the C-terminus has also been verified to be important in binding to plasminogen. In a following study, Bergmann and coworkers [70] identified another plasminogen-binding motif FYDKERKVY within the  $\alpha$ -enolase sequence. The surface-reassociated enolase that binds to plasminogen has an essential role in bacterial pathogenicity. Chhatwal [64] listed some proteins, including *S. pneumonia* PavA, Eno and *S. pyogenes* FBP54, SEN and SDH that lack signal peptides and known membrane anchors, indicating that the reassociation of these secreted proteins could be a general but as-yet-unknown

mechanism.

There are not as many published studies about how intracellular proteins in Gram-negative bacteria become attached on the cell surface after secretion. There are fewer examples in the list of the intracellular/surface moonlighting proteins we've collected so far, with 61 proteins in Gram-positive bacteria but only 19 proteins in Gram-negative bacteria [4], [71], but it is very likely that these intracellular/surface moonlighting proteins adhere to the cell surface by reassociation in both Gram-positive and Gram-negative bacteria. Using electron microscopy, it was shown that the association behavior of 60 kDa Hsp in *H. ducreyi* [26] shares similarity with the reassociation of *S. pneumonia*  $\alpha$ -enolase on the cell surface [69]. Similar transmission electron microscopy studies of *N. meningitides* also manifested the association of enolase, DnaK and peroxiredoxin with the outer membrane after secretion [31]. All of these data suggest that many of the intracellular/surface moonlighting proteins reassociate on cell surface of pathogens after secretion.

### **C. Outline of the Study**

This project aims to find additional candidates for intracellular/surface moonlighting proteins using published proteomics studies and bioinformatics tools. Firstly, the amino acid sequences of proteins found to be localized in cell surface/cell wall proteomes have been gathered. Secondly, protein sequences were analyzed using bioinformatics tools in order to look for proteins that lack transmembrane domain and signal peptides. Finally, the candidate intracellular/surface proteins were categorized based on function.

## II. METHODS

### A. Selections of Proteins for Study

The process of selecting intracellular/surface moonlighting proteins is shown in Figure 2. First, information such as gene locus, Uniprot/NCBI accession numbers, and descriptions of proteins were collected from published proteomics studies that identified proteins on the cell surface. Second, the amino acid sequences were identified through use of the in NCBI [72] or Uniprot [73] databases. Third, proteins with unknown functions or putative functions were left out of the study because we focused on proteins with known intracellular functions. Fourth, transmembrane proteins were discarded because they span and attach to the cell membrane permanently and do not fit the intracellular/surface moonlighting protein category. Fifth, proteins with signal peptides were also ruled out because intracellular/surface moonlighting proteins are secreted with non-classical secretion pathways that lack signal peptide. Finally, PSORTb 3.0 [74] was used as a prediction of the subcellular localization. The programs and databases that were used in the project are shown in Table 3.

Table 3. Programs and database used in the work

<b>Programs and databases</b>	<b>Function</b>
UniProt [73]	Acquisition of amino acid sequences
NCBI [72]	Acquisition of amino acid sequences
TMHMM Server, v. 2.0 [75]	Transmembrane alpha-helices prediction
SignalP 4.0 [76]	Signal peptides prediction
PSORTb 3.0 [74]	Subcellular localization prediction

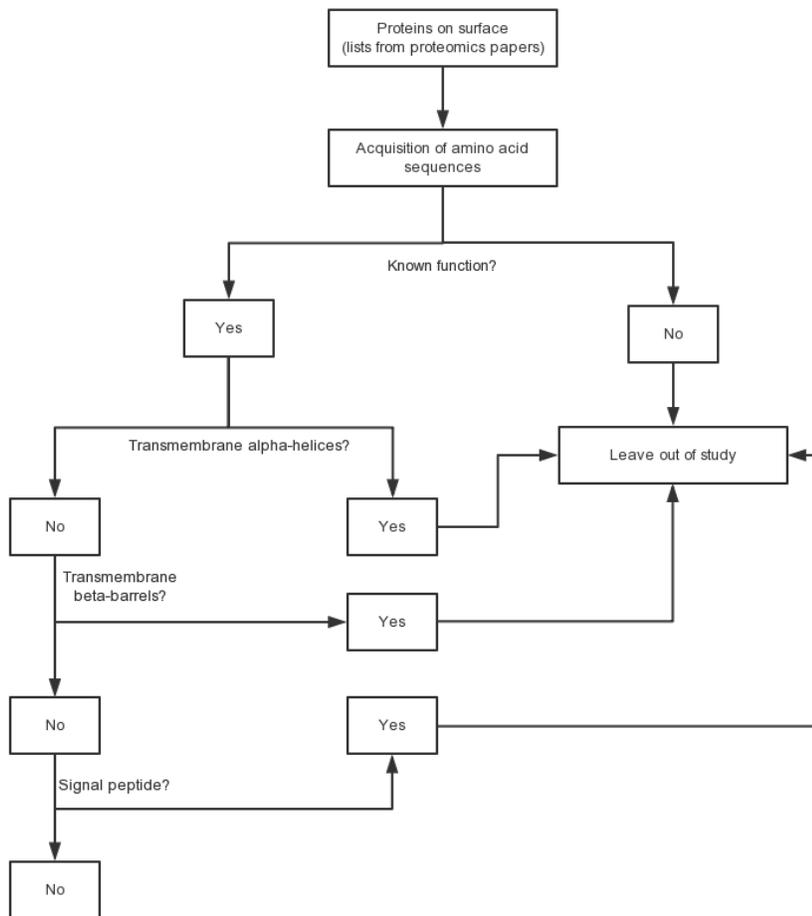

Figure 2. The process of selecting intracellular/surface moonlighting protein candidates.

## **B. Initial Data Acquisition**

The initial data were obtained from published surface proteomics projects for two major reasons: 1) proteomics, the large-scale analysis of proteins fulfills the need for enough information about dozens or hundreds of proteins compared to the traditional laboratory methods; 2) the surface proteomics papers provide information about all of the

proteins present on the cell surface, which may include some proteins that are usually considered to be intracellular. Table 4 lists the proteomics papers from which the lists of surface proteins were gathered.

Table 4. Proteomics papers used in the study

<b>Species</b>	<b>Gram type</b>	<b>Table Used</b>
<i>Bartonella quintana</i> [56]	Negative	Table 2
<i>Clostridium acetobutylicum</i> [77]	Positive	Table S1
<i>Streptococcus suis</i> [78]	Positive	Table S2 and S3
<i>Escherichia Coli</i> [79]	Negative	Table S1 and S2
<i>Capnocytophaga canimorsus</i> [80]	Negative	Table 1
<i>Clostridium thermocellum</i> [81]	Positive	Table S1
<i>Enterococcus faecalis</i> [82]	Positive	Table 1
<i>Pseudomonas aeruginosa</i> [83]	Negative	Table 1 and 2
<i>Staphylococcus aureus</i> [84]	Positive	Table 1
<i>Streptococcus pneumoniae</i> [85]	Positive	Table 3
<i>Shewanella oneidensis</i> [86]	Gram-negative	Table S1
<i>Mycobacterium smegmatis</i> [87]	Acid-fast Gram-positive	Table S3
<i>Neorickettsia sennetsu</i> [88]	Gram-negative	Table 1
<i>Listeria monocytogenes</i> [89]	Gram-positive	Table S1
<i>Listeria monocytogenes</i> [90]	Gram-positive	Table 1
<i>Escherichia Coli</i> [91]	Gram-negative	Table S1
<i>Rickettsia typhi</i> [92]	Gram-negative	Table S3
<i>Rickettsia parkeri</i> [93]	Gram-negative	Table 2
<i>Group A Streptococcus</i> [94]	Gram-positive	Table S1
<i>Group B Streptococcus</i> [95]	Gram-positive	Table S1

### **C. Acquisition of Amino Acid Sequences**

The UniProtKB [73] and the NCBI protein databases [72] were used to collect

protein amino acid sequences using the gene name, locus, UniProt accession number, and/or NCBI accession number provided in the proteomics papers. The amino acid sequences were obtained in FASTA format.

#### **D. Prediction of Transmembrane Alpha-helices**

TMHMM Server v.2.0 [75] was used in the study to predict the presence of TMHs. TMHMM, based on a hidden Markov model, has been tested to have the best performance in predicting TMHs among various prediction servers with almost 100 percent specificity and sensitivity [75]. FASTA sequences were used as input, and the proteins with TMHs were recorded and were separated from the other proteins.

#### **E. Prediction of Signal Peptide**

The SignalP 4.1 Server [76] was used to predict the presence and location of signal peptides. Protein sequences in FASTA format were used as input. The program was run with organism group information based on the cell type because the program was trained using different datasets for Gram-positive and Gram-negative proteins. Gram-negative bacteria also tend to have shorter signal peptides and different D-cutoff values. D-cutoff values were set to default. SignalP-TM network was used by default for Gram-positive bacteria. SignalP-noTM network was used for Gram-negative bacteria for a slightly better result.

## **F. Prediction of Subcellular Localization**

The subcellular localization of proteins was predicted by PSORTb version 3.0.2 [74]. In choosing the cell type, Mycobacterium was input as “Advanced” and “Positive with outer membrane” in “Choose Gram stain”. A score out of ten was reported (high confidence with a high value). Five possible localizations are reported for Gram-negative bacteria and four possible localizations are reported for Gram-positive bacteria [74]. “Unknown” will be reported if no score is over 7.5.

## **G. Functional Analysis**

COG annotation [96] was used to characterize the proteins’ functional categories. COG employed seventeen single letter abbreviations to represent different functional categories.

### III. RESULTS

#### **A. Initial Datasets**

After removing duplicates, 3,027 proteins (data not shown) were collected from the 20 proteomics papers listed in Table 4. Proteins from eight Gram-negative bacterial species were included from the proteomics papers: *B. quintana*, *E. coli*, *C. canimorsus*, *P. aeruginosa*, *S. oneidensis*, *N. sennetsu*, *R. typhi* and *R. parkeri*. Proteins from nine Gram-positive bacterial species were analyzed: *C. acetobutylicum*, *S. suis*, *C. thermocellum*, *E. faecalis*, *S. aureus*, *S. pneumoniae*, *L. monocytogenes*, GAS (*S. pyogenes*), GBS (*S. agalactiae*). One special case is *Mycobacterium smegmatis*, a non-pathogenic bacterium that is considered as Gram-positive bacteria but has a thicker cell wall than most of the other Gram-positive bacteria.

The annotations of these proteins were recorded. 430 of these proteins have annotations such as “hypothetical proteins”, “uncharacterized proteins”, “protein of unknown function”, “conserved hypothetical protein” and etc. These proteins were discarded because they don’t have a distinct function, and I am looking for proteins with a known intracellular function that are also found on the cell surface. 72 proteins don’t have corresponding information in the UniProtKB/NCBI databases and therefore were left out of the study.

#### **B. Prediction of Transmembrane Proteins**

The rest of the proteins were then analyzed with TMHMM server v 2.0 [75], and 627 were predicted to have TMHs. Although TMHs are the majority group of transmembrane

proteins based on structure, the other transmembrane group, transmembrane beta-barrels (TMBs), is not negligible. Tusnády and coworkers [97] established a database called PDBTM, which collected transmembrane protein structures from the PDB. As of February 2015, more than 2,000 transmembrane proteins were found in the PDB, among which 14% are TMBs. Still, the prediction for TMBs is more difficult due to the nature of a TMB structure compared to a TMH structure, which results in insufficient prediction accuracy for TMBs [98]. I used TMBs predictors to predict TMBs, but none of them gave satisfactory results. For example, the FASTA sequence of maltoporin (LamB porins, formed by a TMB) from *E. coli* (gi| 253775338) was input into Pred-TMBB [98]. None of the methods, Viterbi, N-best and Posterior Decoding, predicted it as a protein with TMBs. Viterbi gave the sequence a score of 2.969, which is higher than the 2.965 threshold, indicating that the protein does not have TMBs. Also this predictor gave some false positive results: a lot of cytoplasmic proteins were predicted to be outer membrane proteins with beta-barrels (data not shown). Another limitation of TMB predictors is some of them, such as PROFtmb and Pred-TMBB can be only used for Gram-negative bacteria. However, TMBs exist in both the outer membrane of Gram-negative bacteria and the membrane of Gram-positive bacteria [99]. Therefore, I manually selected proteins with TMBs based on SCOP (Structural Classification of Proteins) classification. SCOP classified TMBs into six superfamilies: OmpA-like, OmpT-like, OmpLA, porins, Txs-like channels and autotransporter [100]. Proteins with annotations similar to these superfamilies were picked out and carefully compared to the existing literature or the PDB database. 38 were classified as proteins with TMBs and thus left out of the study.

### **C. Prediction of Signal Peptides**

The remaining proteins without transmembrane helices or transmembrane beta barrels were analyzed using SignalP 4.1 [76] for best performance. 349 of them were predicted to harbor a signal peptide within the amino acid sequences. SignalP is not able to identify bacterial lipoproteins because the lipoprotein signal peptide is cleaved by signal peptidase II (SPaseII) instead of signal peptide I (SPaseI). In bacteria, lipoproteins are abundant secretory proteins [101]. For example, in *E. coli*, most lipoproteins are attached to the outer membrane, and some are anchored to the inner membrane [102]. Therefore, lipoproteins can be left out of the study because they usually do not have an intracellular function. In fact, most lipoproteins were already left out of the study because they are localized within the cell membrane or periplasmic space. The list was manually checked for lipoproteins, and 17 lipoproteins were left out of the study.

### **D. Prediction of Subcellular Localization**

Up to this point, most of the proteins left in the list are cytoplasmic proteins that may be candidates for intracellular/surface moonlighting proteins. In order to compare the prediction of the subcellular localization, PSORTb 3.0 [74] was used. PSORTb 3.0 not only uses the original six modules including HMMTOP, Signal and SCL-BLAST, but also uses host-associated, T3SS and flagellar spore as new modules [74], [103]. It is able to predict the cellular locations of more types of proteins. For example, flagellar hook protein FlgE from *C. acetobutylicum* (gi|15895423) was correctly predicted as “Flagellar”. Succinate dehydrogenase, a flavoprotein subunit from *E. coli* (gi|1786942) that is part of the electron transport chain, was also correctly predicted as “Cytoplasmic

Membrane”. But sometimes PSORTb was not able to predict the localization of a subunit of a big integral member protein complex correctly.

After careful examination of the localization scores and manual checking, some proteins associated with the cell membrane were grouped into the following categories: ABC transporters and other transmembrane transporters, ATP synthase subunits, flagellin and flagellar hook components, and electron transport chain subunits. Proteins involved with cell division were also considered to be cell membrane associated. “ABC transporters and other transmembrane transporters” include proteins annotated as: ABC transporter/ABC transporter related, metal ion or small molecule transporter (cobalt, iron, arginine transporter, etc.), efflux pump, and part of a translocation system. Alpha, beta, gamma, delta and epsilon subunits of the F1/F0 ATP synthase, located in the mitochondria matrix, were also grouped in the category of “ATP synthase subunits” because they are part of the big membrane complex. The category of “Electron transport chain subunits” includes NADH dehydrogenase, succinate dehydrogenase, cytochrome c dehydrogenase, etc. FtsE, ftsF, ftsZ, ftsY, ftsA, divIVA are proteins that are related to cell division machinery and considered to be cell membrane associated [104]. Other than *ftsA* and *ftsZ* which are intracellular proteins, the rest of the Fts proteins are all membrane proteins [105]. FtsE and ftsX, homologues of ABC transporter are associated with the cell membrane and are involved in translocation and transportation [104]. FtsZ is a GTPase [106] and an analogue of tubulin, and ftsA is an actin homologue. FtsA was found to localize in septum in the presence of the Z ring formed by ftsZ [105]. All of these proteins are part of the cell division machinery, and so I grouped them in the

category of “cell membrane acting” in my study. Figure 3 shows the distribution of the major cell membrane associated protein groups.

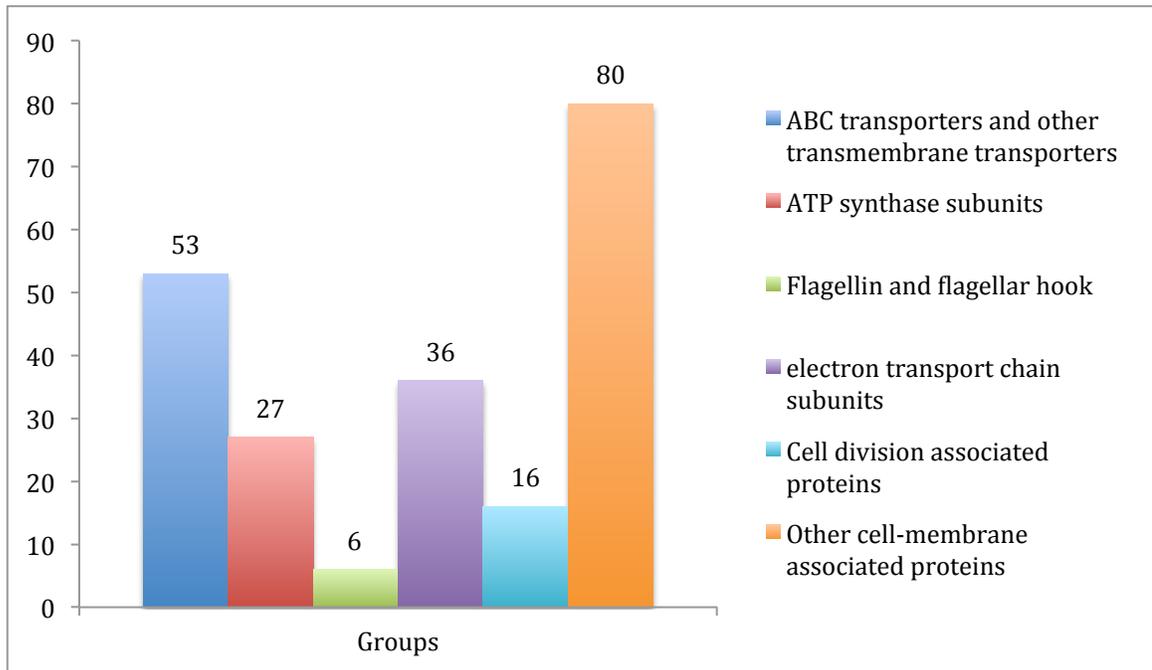

Figure 3. Distribution of the cell membrane-associated proteins. The numbers on each histogram bar represents the number of each group.

### **E. Statistics of the Selection Process**

Figure 4 shows the statistics of the whole selection process. More than three thousand proteins were analyzed initially. More than 1,100 protein were predicted to be intracellular proteins that don't possess transmembrane domains or signal peptides. This result further confirms that some intracellular proteins have the ability to get secreted

across the cell membrane and perform another function on the cell surface.

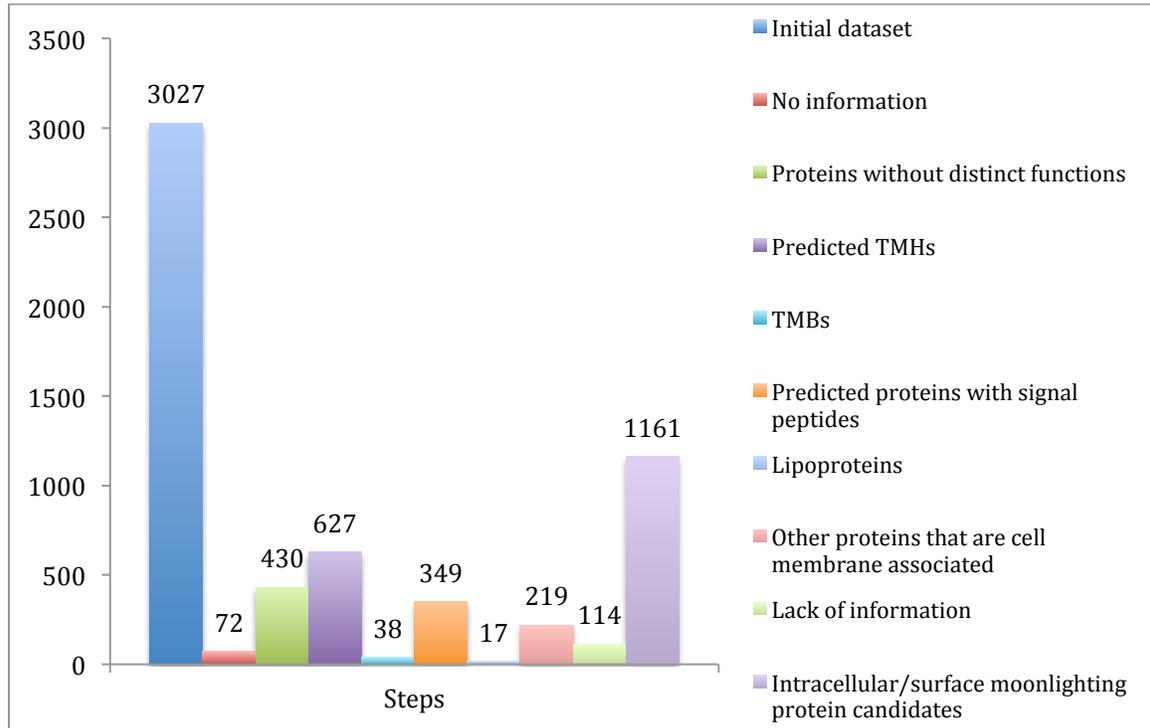

Figure 4. Statistics of the whole selection process. 1161 out of 3027 proteins in the cell surface/cell wall proteomes have been predicted to be intracellular proteins.

#### **F. Intracellular/Surface Moonlighting Protein Candidates**

Appendix I and II list all the predicted cytoplasmic proteins that were identified on the cell surface from the proteomics studies. The NCBI numbers of the proteins were used to search the COG database [96], and the proteins were classified based on COG annotation. The database covers the majority of genomes of the organisms in this study (Table 3) except *E. coli* BL21, *C. thermocellum*, *R. parkeri*, *L. monocytogenes*, *S. suis*, *S.*

*aureus*, GBS. The dominant functional category is J — translation, ribosomal structure and biogenesis [96]. This category consists of ribosomal proteins, tRNA synthetases, translation elongation factors/initiation factors and some other enzymes involved in mRNA degradation or tRNA processing. Another major functional category is O — post-translational modification, protein turnover, chaperones [96]. This group comprises a lot of molecular chaperones, including GroEL chaperonins, chaperone proteins DnaK and DnaJ, and Clp and Lon family proteases. Functional category G — carbohydrate transport and metabolism [96] is another big group, including proteins involved in glycolysis and the pentose phosphate pathway. The major functional groups are shown in Table 5.

Not all the proteins in my list can be found in the COG database. Figure 5 shows that almost three quarters of the intracellular/surface moonlighting protein candidates cannot be found in the COG database. Further investigation of the data (Appendix I and II) shows that the proteins that don't exist in the COG database fit into similar functional groups. Ribosomal/ribosomal associated proteins, molecular chaperones, aminoacyl tRNA synthetases, elongation/initiation/termination factors, enzymes involved in glycolysis, enzymes in replication and transcription, proteins involved in energy production, and proteins in nucleotide transport were also frequently found in the other species on the list.

Table 5. Major functional groups of intracellular/surface moonlighting protein candidates based on COG database classifications

<b>COG code</b>	<b>Function description</b>	<b>Examples</b>
J	Translation, ribosomal structure and biogenesis	30S/50S ribosomal protein; EF-G, EF-Ts, EF-Tu, EF-P, IF; aminoacyl tRNA synthetases
O	Post-translational modification, protein turnover, chaperones	Chaperonin GroEL; chaperone proteins DnaJ, DnaK; Lon/Clp family proteases
G	Carbohydrate transport and metabolism	Aldolase, TPI, GAPDH, phosphoglycerate kinase, phosphoglycerate mutase (PGM), enolase, pyruvate kinase; transketolase
E	Amino acid transport and metabolism	Acetylglutamate kinase, glutamine synthetase
C	Energy production and conversion	Alcohol dehydrogenase, acetate kinase, isocitrate lyase
K	Transcription	Transcription termination factor rho, transcription termination/antitermination protein NusA, DNA-directed RNA polymerase
F	Nucleotide transport and metabolism	GMP synthase, adenylate kinase, Phosphoribosylformylglycinamide synthase
L	Replication, recombination and repair	DNA polymerase I/III, ATP-dependent RNA helicase, DNA gyrase
I	Lipid transport and metabolism	Acetyl-CoA acetyltransferase, acetyl-CoA carboxylase

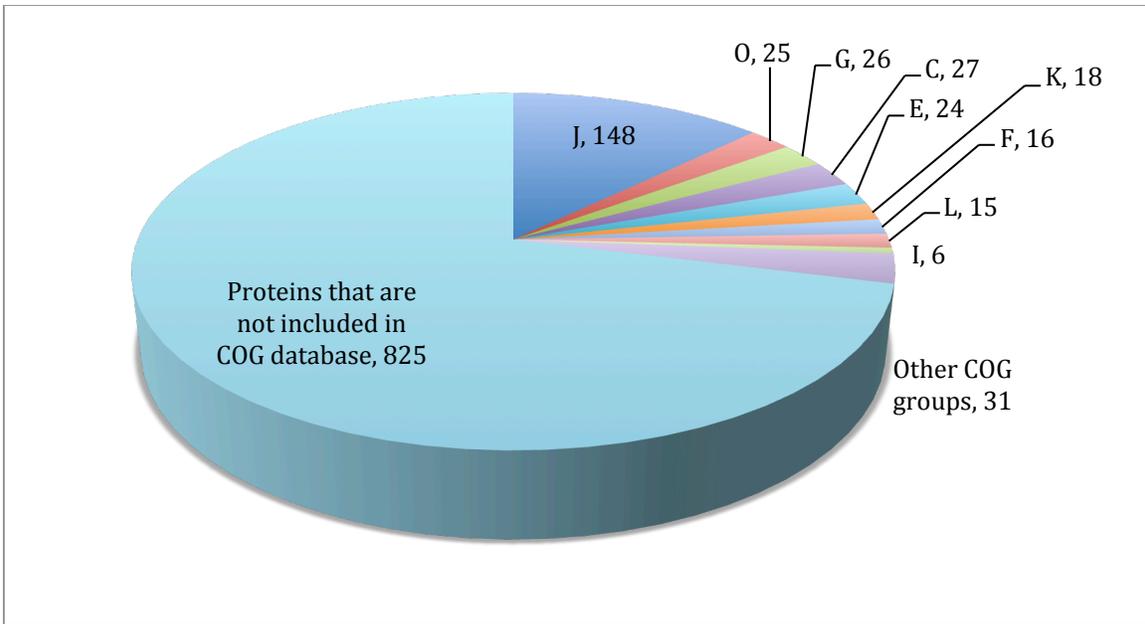

Figure 5. Distribution of the functional groups based on the COG database. The single letter is the COG code representing each functional group.

## IV. DISCUSSIONS

### A. Comparison of Proteomics Experimental Approaches

This study is based on bioinformatics analysis of data from published proteomics studies. A lot of proteins that are known to function in the cytoplasm have been found in the cell wall or cell surface subproteomes. The presence of known cytoplasmic proteins on the cell surface suggests they might be intracellular/surface moonlighting protein candidates.

The proteomics studies that were used in this analysis were based on two popular experimental approaches. The first method is separation of subcellular fractions followed by two-dimensional gel electrophoresis or one-dimensional gel electrophoresis [77], [79] coupled with mass spectrometry. The success of this approach in identifying only cell surface proteins depends on how well the cell membrane is separated from the other subcellular fractions. Some cytoplasmic proteins may “contaminate” the membrane fraction. For example, J. Boonjakuakul and coworkers [56] paid attention to the result that among the 60 identified proteins in the total membrane protein fraction of *B. quintana*, more cytoplasmic proteins were identified than membrane proteins. Yu and coworkers [81] also found a large amount of cytoplasmic proteins in the cell wall proteome.

The second proteomics technique uses proteolytic enzymes such as trypsin to digest proteins on the cell surface followed by mass spectrometry to identify the digested

peptides [78], [94]. This method has been proven to be more selective [94]. This shaving method is able to detect more surface proteins because weakly membrane-attached surface proteins (peripheral membrane proteins) may be lost during the membrane isolation steps of the first method, but fewer integral membrane proteins are identified because integral membrane proteins are embedded in the cell membrane. A good shaving technique should digest the surface proteins efficiently while not damaging the cell surface, which would result in a great amount of contamination from cytoplasmic proteins. However, some cytoplasmic proteins that are identified as being on the cell surface through these proteomics methods may be artifacts from imperfect separation of subfractions or over-digestion of the cell surface. But Schaumburg and coworkers [90] confirmed that a large amount of cytoplasmic proteins in the cell wall subproteomes are actually active on the surface, and they also visualized enolase on the cell surface of *L. monocytogenes*.

### **B. Proteins in DNA Binding and Replication**

A lot of proteins involved in replication, recombination and repair (COG code: L) [96] such as DNA polymerase I, DNA polymerase III, DNA gyrase, RecA, DNA helicase, DnaA, DNA ligase, MutS, and DNA topoisomerases (I, II, IV), were identified in the study. DNA was found a long time ago to bind to the cell membrane and form a DNA-membrane complex during replication in prokaryotic cells [107]. The interaction between DNA and cell membrane is important for the transfer of the daughter chromosome during cell division [107], [108]. This may be an explanation for the presence of some of the proteins that interact with DNA, such as DNA-dependent RNA polymerase and RNA

termination factor Rho, on the cell surface (Appendix I and II).

### **C. Proteins in Protein Biogenesis**

Ribosomal proteins comprise the most abundant functional group found on our list. Although a lot of ribosomal proteins exist in the MoonProt database [4], none of them are known to have a second function on the cell surface. Because ribosomes play an important role in the biogenesis of membrane proteins and secreted proteins and can be membrane associated, it is reasonable that many of the ribosomal proteins were identified in the surface proteome. Ribosomes interact with translocons with high affinity in the cotranslational assembly of membrane proteins or secreted proteins. This behavior has been proven to be evolutionarily conserved [109]. Aminoacyl tRNA synthetases are enzymes that link the proper amino acid to a tRNA that contains the corresponding anticodon. They are important enzymes in protein translation and biogenesis. Similar to ribosomal proteins, during protein synthesis of membrane proteins, they can be membrane associated. Many of them have been found to perform more than one function inside of the cell. But whether or not they can be on the cell surface and perform a second role is not clear. It is interesting that Olmedo-Verd and coworkers [110] found that four aminoacyl tRNA synthetases have putative transmembrane domains in cyanobacteria.

Four elongation factors EF-Tu, EF-Ts, EF-G and EF-P were identified by several of the proteomics studies. They are required for protein synthesis in prokaryotes. EF-Ts, EF-G and EF-P are not currently in the MoonProt database [4]. EF-Ts is the exchange factor that induces the release of GDP from EF-Tu [111]. EF-G binds to the ribosome and

helps the translocation of tRNA from the A site to P site [112]. EF-P is required in peptide bond synthesis on ribosomes [113]. The close relation of these three elongation factors in protein translation with ribosomes may explain why these elongation factors were identified in the surface proteomics studies, while whether they are moonlighting proteins on the cell surface requires more experimental evidence. However, *L. johnsonii* and *L. plantarum* EF-Tu have been identified to be intracellular/surface moonlighting proteins that mediate the attachment of the bacteria to human cells [25], [114]. *Mycoplasma pneumonia* EF-Tu on the cell surface has been found to bind host fibronectin [115]. *P. aeruginosa* EF-Tu has also been found to localize to the cell surface and bind to plasminogen [116]. The additional EF-Tu proteins on the list might be strong intracellular/surface moonlighting protein candidates.

#### **D. Molecular Chaperones**

Intracellular molecular chaperones are found in many species to also be found on the cell surface. Several of these intracellular/surface moonlighting proteins are found in the MoonProt database [4]. DnaK and GroEL are stress proteins that play a critical role in protein folding and help protect proteins from stress [117]. On the cell surface, several Hsp70/DnaK proteins show high affinity for plasminogen [18], [31], [90], and Hsp60/GroEL proteins function as adhesins [24], [26], [27], [29] that serve as cell signaling proteins and help the bacteria to interact with host cells [118]. Katakura and coworkers [37] found that DnaK and Hsp60/GroEL on the cell surface of *L. lactis* can bind to mannoprotein of yeast cells and might help reduce the stress on the yeast surface caused by lactic acid. DnaJ, Clp and Lon family proteases were also found on the cell

surface in several species. Despite lacking direct evidence of a second function of some of these chaperones on the cell surface, they have been proven to promote intracellular growth of intracellular pathogens and thus enhance the virulence of these pathogens [119], [120]. DjlA, a member of Hsp40/DnaJ family, was found to be important for the growth of *L. dumoffii* in host cells and probably was essential in folding and transporting the membrane protein Dot/Icm that is part of the type IV secretion system (T4SS) [121]. Therefore, it might be transiently associated with the cell membrane. Trigger factor is a cytoplasmic chaperone protein that can bind to and disassociate from the ribosome [122]. Ribosomal protein L23 has both binding sites for trigger factor and signal recognition particle and helps with protein targeting to the cell membrane [123]. This explains the appearance of trigger factor in the cell membrane proteomes.

### **E. Metabolic Enzymes**

It is interesting that most of the proteins used in glycolysis in bacteria can perform moonlighting functions on the cell surface. They bind to plasminogen, fibronectin, laminin and can also serve as adhesins [118]. The MoonProt database [4] includes a great number of cytoplasmic enzymes in central metabolism that are also surface moonlighting proteins in various species. Aldolase, TPI, GAPDH, phosphoglycerate kinase, PGM, enolase, and pyruvate kinase were identified from this proteomics project in many other species (Appendix I and II), possibly expanding this group of moonlighting proteins to more species.

## **F. Other Candidates for Intracellular/Surface Moonlighting Proteins**

Some of the proteins on the list (Appendix I and II), enolase and GAPDH from *S. aureus* and *S. suis*, for instance, have been identified to be moonlighting proteins and were collected in the MoonProt database [4] already. As discussed before, proteins that belong to the molecular chaperones and carbohydrate metabolism categories but not yet identified to moonlight on the cell surface may be intracellular/surface moonlighting proteins. There are many other cytoplasmic proteins on the list (Appendix I and II) that don't belong to these two groups. Several alcohol dehydrogenases, involved in energy production and conversion [124], were found on the cell surface of *E. coli BL21*, *S. oneidensis*, *C. thermocellum*, *L. monocytogenes*, and *S. suis*. Among them, alcohol acetaldehyde dehydrogenase has been identified to act as an adhesin on the cell surface of *L. monocytogenes* [125] and is listed in the MoonProt database [4]. The rest of the alcohol dehydrogenases are strong candidates to be intracellular/surface moonlighting proteins as well. Similarly, 2-oxoglutarate dehydrogenase, an important complex in the TCA cycle that is also involved in energy production, was found on the cell surface in several species (Appendix I and II). Other than these proteins discussed above, proteins such as acetate kinase, acetylglutamate kinase, aconitate hydratase, adenylate kinase, carbamoyl-phosphate synthase, citrate synthase, dihydrolipoamide dehydrogenase were also commonly found on the cell surface (Appendix I and II). They may play a distinct role on the cell surface, although there's no evidence as to a second function currently.

## **G. Reproducibility of Different Proteomics Methods**

Among the proteomic papers we've used in our study (Table 2), two of them used *L.*

*monocytogenes*. Schuamburg and coworkers [90] identified the cell wall subproteome using MALDI-TOF mass spectrometry (MS). Portillo and coworkers [89] used high resolution MS to study the cell wall proteome of intracellular and extracellular *L. monocytogenes*. Some of the proteins were found in the proteomes of both studies, suggesting the reproducibility of these proteomics results. Fourteen proteins were found in both studies with the gene names: Lmo2653, Lmo2068, Lmo1473, Lmo2459, Lmo2455, Lmo1657, Lom2556, Lmo0223, Lmo2458, Lmo2654, Lmo1055, Lmo1634, Lmo2456 and Lmo1314. They are EF-Tu, GroEL, DnaK, GAPDH, enolase, EF-Ts, fructose-1,6-bisphosphate aldolase, cysteine synthase, phosphoglycerate kinase, EF-G, and dihydrolipoamide dehydrogenase, alcohol-acetaldehyde dehydrogenase, PGM and ribosome recycling factors, respectively. EF-Tu, EF-Ts, EF-G and ribosome recycling factors are associated with the ribosome. GroEL and DnaK are molecular chaperones. The rest are mainly metabolic enzymes. Most of these proteins have been discussed above and further support the model that the presence of these cytoplasmic proteins on the cell surface are not artifacts.

## V. Conclusions and Future Work

This work selected candidates for intracellular/surface moonlighting proteins in many bacterial species from proteomics studies. Bioinformatics analysis has been extensively used throughout this work. The availability of bioinformatics tools makes it easier and less time-consuming to analyze the localization of proteins, but they are not always accurate. Careful use of the software or servers is required. Whether or not these proteins are real moonlighting proteins needs experimental verification. This work helps scientists to identify potential additional localizations of intracellular proteins and suggests candidates that also might play additional roles on the cell surface, such as a plasminogen binding protein or an adhesin.

The known intracellular/surface moonlighting proteins don't possess signal peptides or cell surface anchor motifs. One major question remaining to be elucidated is how these intracellular/surface moonlighting proteins get secreted. In the introduction, some potential secretion pathways have been illustrated. However, more experimental evidence is needed to verify which non-classical secretion pathways might be involved. Different proteins in different species may adopt different secretion pathways, adding the complexity of the research on secretion pathways.

Another question is how these proteins adhere onto the cell surface without an anchor motif. Although a lot of experiments have proved that some intracellular proteins have the ability to “stay” on the cell surface and perform another function there, how

these proteins get re-associated on the cell surface and how they can adhere there and perform a second function is still unknown.

The reason that these proteins can perform another role can be explained as follows: most of the intracellular/surface moonlighting protein candidates are chaperones or proteins involved in carbohydrate metabolisms. These proteins are ubiquitous in almost every bacterial species (and in many cases eukaryotic and archael species as well) and have been evolving for a very long time. Organisms tend to use the proteins that they already have instead of making a new proteins [126].

Future work includes but is not limited to searching for a common sequence or structural motif among all the identified intracellular/surface moonlighting proteins. They may share some common secretion motif or anchor motif within their protein sequences. Searching for such a sequence might be done by using bioinformatics prediction programs. But those predictions have some limitations. Different settings of parameters change the prediction results greatly. So when the length of the motif is unknown, it is very hard to select the best range of lengths of the potential motif sequences. Also, some predictors cannot identify sequence motifs containing gaps, such as LPXTG where X is any amino acid. “Wet work” needs to be combined with bioinformatics programs in order to look for sequence motifs that might be involved in selecting these intracellular/surface proteins for secretion and/or attachment to the cell surface.

**Appendix II – The Other Intracellular/Surface Moonlighting Protein Candidates  
that are not Included in the COG Database**

Author, Year	Species	Gram type	UniProt #	NCBI #	Gene locus	Function description
Boonjakuakul, 2007	<i>B. quintana</i>	Negative	Q6FZ43		ctrA	Cell cycle transcriptional regulator
Boonjakuakul, 2007	<i>B. quintana</i>	Negative	Q6G0F7		prsA	Ribose-phosphate pyrophosphokinase
Boonjakuakul, 2007	<i>B. quintana</i>	Negative	Q6G1E5		hrcA	Heat-inducible transcription repressor
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15896327		Phosphate butyryltransferase (Phosphotransbutyrylase)
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 18266735		Pyruvate kinase
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 3914324		Phosphoglycerate kinase alpha
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15895958		Inositol-5'-monophosphate dehydrogenase
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15895341	spo0A	Stage 0 sporulation protein A homolog
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15895023	plsX	Glycerol-3-phosphate acyltransferase PlsX
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15896376		50S ribosomal protein L16
Mao, 2011	<i>C. acetobutylicum</i>	Positive		gi 15896396		50S ribosomal protein L11
Vecchietti, 2012	<i>P. aeruginosa</i>	Negative	P15276		algP algR3 PA5253	Transcriptional regulatory protein AlgP
Vecchietti, 2012	<i>P. aeruginosa</i>	Negative	G3XCY4		amrZ PA3385	Alginate and motility regulator Z AmrZ
Gibson, 2010	<i>N. sennetsu</i>	Negative	Q2GDR7		NSE_0495	Heat shock protein HtpG
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EKR9	24371621	SO_0021	Fatty acid oxidation complex subunit alpha
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EK30		SO_0274	Phosphoenolpyruvate carboxylase
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EJ61	24372202	SO_0611	Transcriptional activator SspA
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EGS5	24373093	SO_1519	L-lactate dehydrogenase iron-sulfur cluster-binding protein LldF
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EGS4	24373094	SO_1520	L-lactate dehydrogenase complex protein LldE
Zhang 2010	<i>S. oneidensis</i>	Negative	Q8EAQ9	24375327	SO_3837	Ribose-phosphate pyrophosphokinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773763		Bifunctional acetaldehyde-CoA/alcohol dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771754		Glycogen/starch/alpha-glucan phosphorylase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775592		Transcription termination factor Rho
Thein, 2010	<i>E. coli</i> BL21	Negative		253775172		50S ribosomal protein L9
Thein, 2010	<i>E. coli</i> BL21	Negative		253771436		Chromosomal replication initiator protein DnaA
Thein, 2010	<i>E. coli</i> BL21	Negative		253771438		DNA replication and repair protein RecF
Thein, 2010	<i>E. coli</i> BL21	Negative		253771439		DNA gyrase, B subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253771451		Heat shock protein Hsp20

Thein, 2010	<i>E. coli</i> BL21	Negative		253771508		(p)ppGpp synthetase I, SpoT/RelA
Thein, 2010	<i>E. coli</i> BL21	Negative		253773135		Excinuclease ABC, C subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253771522		50S ribosomal protein L28
Thein, 2010	<i>E. coli</i> BL21	Negative		253771523		50S ribosomal protein L33
Thein, 2010	<i>E. coli</i> BL21	Negative		253771526		Three-deoxy-D-manno-octulosonic-acid transferase domain protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253771540		2-amino-3-ketobutyrate coenzyme A ligase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771541		L-threonine 3-dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771605		Glycyl-tRNA synthetase, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253771606		Glycyl-tRNA synthetase, beta subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253771742		Glycogen/starch synthase, ADP-glucose type
Thein, 2010	<i>E. coli</i> BL21	Negative		253771745		FAD dependent oxidoreductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771755		4-alpha-glucanotransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771768		Phosphoenolpyruvate carboxykinase (ATP)
Thein, 2010	<i>E. coli</i> BL21	Negative		253771813		Glutamine amidotransferase of anthranilate synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771832		30S ribosomal protein S12
Thein, 2010	<i>E. coli</i> BL21	Negative		253771833		30S ribosomal protein S7
Thein, 2010	<i>E. coli</i> BL21	Negative		253771834		Translation elongation factor G
Thein, 2010	<i>E. coli</i> BL21	Negative		253771835		Translation elongation factor Tu
Thein, 2010	<i>E. coli</i> BL21	Negative		253771855		30S ribosomal protein S10
Thein, 2010	<i>E. coli</i> BL21	Negative		253771856		50S ribosomal protein L3
Thein, 2010	<i>E. coli</i> BL21	Negative		253771857		50S ribosomal protein L4
Thein, 2010	<i>E. coli</i> BL21	Negative		253771858		50S ribosomal protein L23
Thein, 2010	<i>E. coli</i> BL21	Negative		253771859		50S ribosomal protein L2
Thein, 2010	<i>E. coli</i> BL21	Negative		253771860		30S ribosomal protein S19
Thein, 2010	<i>E. coli</i> BL21	Negative		253771861		50S ribosomal protein L22
Thein, 2010	<i>E. coli</i> BL21	Negative		253771862		30S ribosomal protein S3
Thein, 2010	<i>E. coli</i> BL21	Negative		253771863		50S ribosomal protein L16
Thein, 2010	<i>E. coli</i> BL21	Negative		253771865		30S ribosomal protein S17
Thein, 2010	<i>E. coli</i> BL21	Negative		253771866		50S ribosomal protein L14
Thein, 2010	<i>E. coli</i> BL21	Negative		253771867		50S ribosomal protein L24
Thein, 2010	<i>E. coli</i> BL21	Negative		253771868		50S ribosomal protein L5
Thein, 2010	<i>E. coli</i> BL21	Negative		253771869		30S ribosomal protein S14
Thein, 2010	<i>E. coli</i> BL21	Negative		253771870		30S ribosomal protein S8
Thein, 2010	<i>E. coli</i> BL21	Negative		253771871		50S ribosomal protein L6
Thein, 2010	<i>E. coli</i> BL21	Negative		253771872		50S ribosomal protein L18
Thein, 2010	<i>E. coli</i> BL21	Negative		253771873		30S ribosomal protein S5
Thein, 2010	<i>E. coli</i> BL21	Negative		253771874		50S ribosomal protein L30
Thein, 2010	<i>E. coli</i> BL21	Negative		253771875		50S ribosomal protein L15

Thein, 2010	<i>E. coli</i> BL21	Negative		253771877		50S ribosomal protein L36
Thein, 2010	<i>E. coli</i> BL21	Negative		253771878		30S ribosomal protein S13
Thein, 2010	<i>E. coli</i> BL21	Negative		253771879		30S ribosomal protein S11
Thein, 2010	<i>E. coli</i> BL21	Negative		253771880		30S ribosomal protein S4
Thein, 2010	<i>E. coli</i> BL21	Negative		253771881		DNA-directed RNA polymerase, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253771882		50S ribosomal protein L17
Thein, 2010	<i>E. coli</i> BL21	Negative		253771914		Acetyl-CoA carboxylase, biotin carboxylase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771915		Acetyl-CoA carboxylase, biotin carboxyl carrier protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253771923		maf protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253771924		Ribonuclease, Rne/Rng family
Thein, 2010	<i>E. coli</i> BL21	Negative		253771940		50S ribosomal protein L13
Thein, 2010	<i>E. coli</i> BL21	Negative		253771941		30S ribosomal protein S9
Thein, 2010	<i>E. coli</i> BL21	Negative		253771980		50S ribosomal protein L21
Thein, 2010	<i>E. coli</i> BL21	Negative		253771981		50S ribosomal protein L27
Thein, 2010	<i>E. coli</i> BL21	Negative		253771987		Ribosomal RNA large subunit methyltransferase J
Thein, 2010	<i>E. coli</i> BL21	Negative		253771993		Argininosuccinate synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253771995		NusA antitermination factor
Thein, 2010	<i>E. coli</i> BL21	Negative		253771996		Translation initiation factor IF-2
Thein, 2010	<i>E. coli</i> BL21	Negative		253771999		30S ribosomal protein S15
Thein, 2010	<i>E. coli</i> BL21	Negative		253772000		Polyribonucleotide nucleotidyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772018		Uroporphyrin-III C/tetrapyrrole (Corrin/Porphyrin) methyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772097		RNA polymerase, sigma 70 subunit, RpoD
Thein, 2010	<i>E. coli</i> BL21	Negative		253772099		30S ribosomal protein S21
Thein, 2010	<i>E. coli</i> BL21	Negative		253772110		Adenylate cyclase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772112		rfaE bifunctional protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253772132		DNA topoisomerase IV, B subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772143		DNA topoisomerase IV, A subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772151		2,5-didehydrogluconate reductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772220		S-adenosylmethionine synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772225		Transketolase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772234		Phosphoglycerate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772235		Fructose-bisphosphate aldolase, class II
Thein, 2010	<i>E. coli</i> BL21	Negative		253772256		Glycine dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772269		Lysyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772290		PAS modulated sigma54 specific transcriptional regulator, Fis family
Thein, 2010	<i>E. coli</i> BL21	Negative		253772317		PTSINtr with GAF domain, PtsP
Thein, 2010	<i>E. coli</i> BL21	Negative		253772319		Thymidylate synthase

Thein, 2010	<i>E. coli</i> BL21	Negative		253772328		Amino-acid N-acetyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772337		SAM-dependent methyltransferase-like protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253772365		(p)ppGpp synthetase I, SpoT/RelA
Thein, 2010	<i>E. coli</i> BL21	Negative		253772370		Enolase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772411		DNA mismatch repair protein MutS
Thein, 2010	<i>E. coli</i> BL21	Negative		253772418		Hydrogenase accessory protein HypB
Thein, 2010	<i>E. coli</i> BL21	Negative		253772440		Short-chain dehydrogenase/reductase SDR
Thein, 2010	<i>E. coli</i> BL21	Negative		253772446		recA protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253772448		Alanyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772497		30S ribosomal protein S16
Thein, 2010	<i>E. coli</i> BL21	Negative		253772498		16S rRNA processing protein RimM
Thein, 2010	<i>E. coli</i> BL21	Negative		253772500		50S ribosomal protein L19
Thein, 2010	<i>E. coli</i> BL21	Negative		253772512		ATP-dependent chaperone ClpB
Thein, 2010	<i>E. coli</i> BL21	Negative		253772518		Thioredoxin
Thein, 2010	<i>E. coli</i> BL21	Negative		253772519		tRNA/rRNA methyltransferase (SpoU)
Thein, 2010	<i>E. coli</i> BL21	Negative		253772524		DEAD/DEAH box helicase domain protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253772534		Ribonuclease III
Thein, 2010	<i>E. coli</i> BL21	Negative		253772553		Glycine hydroxymethyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772571		Inositol monophosphatase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772574		cysteine desulfurase IscS
Thein, 2010	<i>E. coli</i> BL21	Negative		253772581		PepB aminopeptidase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772588		Nucleoside-diphosphate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772589		radical SAM enzyme, Cfr family
Thein, 2010	<i>E. coli</i> BL21	Negative		253772591		1-hydroxy-2-methyl-2-(E)-butenyl 4-diphosphate synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772592		Histidyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772598		Inosine-5'-monophosphate dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772599		Transcriptional regulator, XRE family
Thein, 2010	<i>E. coli</i> BL21	Negative		253772606		Ppx/GppA phosphatase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772610		Uracil phosphoribosyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772632		Phosphoribosylaminoimidazole-succinocarboxamide synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772684		Phosphoenolpyruvate-protein phosphotransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772690		DNA ligase, NAD-dependent
Thein, 2010	<i>E. coli</i> BL21	Negative		253772695		Glutamyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772753		Beta-ketoacyl synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772760		Acetyl-CoA carboxylase, carboxyl transferase, beta subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772779		Phosphate acetyltransferase

Thein, 2010	<i>E. coli</i> BL21	Negative		253772780		Acetate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772786		Aminotransferase class I and II
Thein, 2010	<i>E. coli</i> BL21	Negative		253772820		Polysaccharide deacetylase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772836		Glycerol-3-phosphate dehydrogenase, anaerobic, A subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772843		Ribonucleoside-diphosphate reductase, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772846		DNA gyrase, A subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772856		Two component, sigma 54 specific, transcriptional regulator, Fis family
Thein, 2010	<i>E. coli</i> BL21	Negative		253772883		Two component transcriptional regulator, LuxR family
Thein, 2010	<i>E. coli</i> BL21	Negative		253772888		50S ribosomal protein L25
Thein, 2010	<i>E. coli</i> BL21	Negative		253772890		Pseudouridine synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772921		GTP cyclohydrolase I
Method 2	<i>E. coli</i> BL21	Negative		253772967		Hydroxyethylthiazole kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772968		Phosphomethylpyrimidine kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253772976		D-tagatose-bisphosphate aldolase, class II, non-catalytic subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253772980		Alcohol dehydrogenase GroES domain protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253773002		Uridine kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773042		6-phosphogluconate dehydrogenase, decarboxylating
Thein, 2010	<i>E. coli</i> BL21	Negative		253773049		Histidinol-phosphatase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773140		Ferroxidase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773167		Arginyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773189		Pyruvate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773190		Transcriptional regulator, RpiR family
Thein, 2010	<i>E. coli</i> BL21	Negative		253773192		Glucose-6-phosphate 1-dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773214		ProQ activator of osmoprotectant transporter ProP
Thein, 2010	<i>E. coli</i> BL21	Negative		253773233		L-serine dehydratase 1
Thein, 2010	<i>E. coli</i> BL21	Negative		253773266		Glyceraldehyde-3-phosphate dehydrogenase, type I
Thein, 2010	<i>E. coli</i> BL21	Negative		253773281		Selenide, water dikinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773298		Acetylornithine and succinylornithine aminotransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773326		Threonyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773327		Translation initiation factor IF-3
Thein, 2010	<i>E. coli</i> BL21	Negative		253773328		50S ribosomal protein L35
Thein, 2010	<i>E. coli</i> BL21	Negative		253773329		50S ribosomal protein L20
Thein, 2010	<i>E. coli</i> BL21	Negative		253773333		Integration host factor, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253773340		Phospho-2-dehydro-3-deoxyheptonate aldolase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773343		Phosphoenolpyruvate synthase

Thein, 2010	<i>E. coli</i> BL21	Negative		253773380		Cyclopropane-fatty-acyl-phospholipid synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773403		Pyridoxamine 5'-phosphate oxidase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773404		Tyrosyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773420		Adenosine deaminase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773433		Fumarate hydratase, class II
Thein, 2010	<i>E. coli</i> BL21	Negative		253773612		ATP-dependent helicase HrpA
Thein, 2010	<i>E. coli</i> BL21	Negative		253773712		Exoribonuclease II
Thein, 2010	<i>E. coli</i> BL21	Negative		253773729		DNA topoisomerase I
Thein, 2010	<i>E. coli</i> BL21	Negative		253773734		Pseudouridine synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773739		Anthranilate phosphoribosyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773763		D-tagatose-bisphosphate aldolase, class II, non-catalytic subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253773766		UTP-glucose-1-phosphate uridylyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773794		Ribose-phosphate pyrophosphokinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773798		GTP-binding protein YchF
Thein, 2010	<i>E. coli</i> BL21	Negative		253773882		3-oxoacyl-(acyl-carrier-protein) synthase 2
Thein, 2010	<i>E. coli</i> BL21	Negative		253773884		3-oxoacyl-(acyl-carrier-protein) reductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773886		3-oxoacyl-(acyl-carrier-protein) synthase III
Thein, 2010	<i>E. coli</i> BL21	Negative		253773887		Fatty acid/phospholipid synthesis protein PlsX
Thein, 2010	<i>E. coli</i> BL21	Negative		253773888		50S ribosomal protein L32
Thein, 2010	<i>E. coli</i> BL21	Negative		253773891		Pseudouridine synthase, RluA family
Thein, 2011	<i>E. coli</i> BL21	Negative		253773892		Ribonuclease, Rne/Rng family
Thein, 2010	<i>E. coli</i> BL21	Negative		253773910		Ribosomal-protein-alanine N-acetyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253773956		Delta-1-pyrroline-5-carboxylate dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774008		UvrD/REP helicase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774041		Asparaginyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774043		Aspartate transaminase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774047		Chromosome segregation and condensation protein MukB domain protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253774059		Integration host factor, beta subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774060		30S ribosomal protein S1
Thein, 2010	<i>E. coli</i> BL21	Negative		253774068		Formate acetyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774082		Transcriptional regulator, AsnC family
Thein, 2010	<i>E. coli</i> BL21	Negative		253774088		ATP-dependent Clp protease, ATP-binding subunit clpA
Thein, 2010	<i>E. coli</i> BL21	Negative		253774141		RNA-directed DNA polymerase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774218		Excinuclease ABC, B subunit

Thein, 2010	<i>E. coli</i> BL21	Negative		253774281		Phosphoglycerate mutase 1 family
Thein, 2010	<i>E. coli</i> BL21	Negative		253774302		Succinyl-CoA synthetase, beta subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774303		2-oxoglutarate dehydrogenase, E2 subunit, dihydrolipoamide succinyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774304		2-oxoglutarate dehydrogenase, E1 subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774310		Citrate synthase I
Thein, 2010	<i>E. coli</i> BL21	Negative		253774355		tRNA-i(6)A37 thiotransferase enzyme MiaB
Thein, 2010	<i>E. coli</i> BL21	Negative		253774372		Leucyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774386		Lipoic acid synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774410		Peroxisredoxin
Thein, 2010	<i>E. coli</i> BL21	Negative		253774487		Peptidyl-prolyl cis-trans isomerase cyclophilin type
Thein, 2010	<i>E. coli</i> BL21	Negative		253774537		Heat shock protein Hsp90
Thein, 2010	<i>E. coli</i> BL21	Negative		253774569		Histone family protein DNA-binding protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253774573		ATP-dependent Clp protease, ATP-binding subunit ClpX
Thein, 2010	<i>E. coli</i> BL21	Negative		253774574		ATP-dependent Clp protease, proteolytic subunit ClpP
Thein, 2010	<i>E. coli</i> BL21	Negative		253774592		Thiamine biosynthesis/tRNA modification protein ThiI
Thein, 2010	<i>E. coli</i> BL21	Negative		253774595		Deoxyxylulose-5-phosphate synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774599		NusB antitermination factor
Thein, 2010	<i>E. coli</i> BL21	Negative		253774646		Porphobilinogen synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774666		Transcriptional regulator, LacI family
Thein, 2010	<i>E. coli</i> BL21	Negative		253774731		Glutamate 5-kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774738		Aminoacyl-histidine dipeptidase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774778		Prolyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774788		Acetyl-CoA carboxylase, carboxyl transferase, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774789		DNA polymerase III, alpha subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774793		Beta-hydroxyacyl-(acyl-carrier-protein) dehydratase FabZ
Thein, 2010	<i>E. coli</i> BL21	Negative		253774802		Uridylate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774803		Translation elongation factor Ts
Thein, 2010	<i>E. coli</i> BL21	Negative		253774804		30S ribosomal protein S2
Thein, 2010	<i>E. coli</i> BL21	Negative		253774807		2,3,4,5-tetrahydropyridine-2,6-dicarboxylate N-succinyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774812		Deoxyguanosinetriphosphate triphosphohydrolase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774818		Glutamate-1-semialdehyde-2,1-aminomutase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774829		poly(A) polymerase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774838		3-methyl-2-oxobutanoate hydroxymethyltransferase

Thein, 2010	<i>E. coli</i> BL21	Negative		253774851		Spermidine synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774854		Aconitate hydratase 2
Thein, 2010	<i>E. coli</i> BL21	Negative		253774856		Dihydrolipoamide dehydrogenase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774857		Pyruvate dehydrogenase complex dihydrolipoamide acetyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774858		2-oxo-acid dehydrogenase E1 subunit, homodimeric type
Thein, 2010	<i>E. coli</i> BL21	Negative		253774859		Regulatory protein GntR HTH
Thein, 2010	<i>E. coli</i> BL21	Negative		253774874		UDP-3-0-acyl N-acetylglucosamine deacetylase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774879		UDP-N-acetylmuramate/alanine ligase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774888		S-adenosyl-methyltransferase MraW
Thein, 2010	<i>E. coli</i> BL21	Negative		253774901		extracellular solute-binding protein family 5
Thein, 2010	<i>E. coli</i> BL21	Negative		253774911		SNF2-related protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253774920		Dihydrofolate reductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774934		Carbamoyl-phosphate synthase, large subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774935		Carbamoyl-phosphate synthase, small subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253774937		Dihydrodipicolinate reductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774942		Isoleucyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774945		30S ribosomal protein S20
Thein, 2010	<i>E. coli</i> BL21	Negative		253774954		Chaperone protein DnaJ
Thein, 2010	<i>E. coli</i> BL21	Negative		253774955		Chaperone protein DnaK
Thein, 2010	<i>E. coli</i> BL21	Negative		253774960		Transaldolase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774966		Aspartate kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253774980		Transcriptional regulator, XRE family
Thein, 2010	<i>E. coli</i> BL21	Negative		253775000		rRNA (guanine-N(2)-)-methyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775029		Type I site-specific deoxyribonuclease
Thein, 2010	<i>E. coli</i> BL21	Negative		253775117		Leucyl aminopeptidase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775119		Valyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775135		Alpha, alpha-phosphotrehalase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775137		Anaerobic ribonucleoside-triphosphate reductase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775173		30S ribosomal protein S18
Thein, 2010	<i>E. coli</i> BL21	Negative		253775175		30S ribosomal protein S6
Thein, 2010	<i>E. coli</i> BL21	Negative		253775195		RNA methyltransferase, TrmH family, group 3
Thein, 2010	<i>E. coli</i> BL21	Negative		253775196		VacB and RNase II family 3'-5' exoribonuclease
Thein, 2010	<i>E. coli</i> BL21	Negative		253775198		Adenylosuccinate synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775202		GTP-binding protein HflX
Thein, 2010	<i>E. coli</i> BL21	Negative		253775203		RNA chaperone Hfq

Thein, 2010	<i>E. coli</i> BL21	Negative		253775229		Chaperonin GroEL
Thein, 2010	<i>E. coli</i> BL21	Negative		253775230		Chaperonin Cpn10
Thein, 2010	<i>E. coli</i> BL21	Negative		253775233		Aspartate ammonia-lyase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775242		Lysyl-tRNA synthetase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775303		Acetate/CoA ligase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775313		Excinuclease ABC, A subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253775320		Replicative DNA helicase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775357		Methionine synthase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775358		Transcriptional regulator, IclR family
Thein, 2010	<i>E. coli</i> BL21	Negative		253775360		Isocitrate lyase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775362		Homoserine O-succinyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775370		Histone family protein DNA-binding protein
Thein, 2010	<i>E. coli</i> BL21	Negative		253775383		DNA-directed RNA polymerase, beta' subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253775384		DNA- directed RNA polymerase, beta subunit
Thein, 2010	<i>E. coli</i> BL21	Negative		253775385		50S ribosomal protein L7/L12
Thein, 2010	<i>E. coli</i> BL21	Negative		253775386		50S ribosomal protein L10
Thein, 2010	<i>E. coli</i> BL21	Negative		253775387		50S ribosomal protein L1
Thein, 2010	<i>E. coli</i> BL21	Negative		253775388		50S ribosomal protein L11
Thein, 2010	<i>E. coli</i> BL21	Negative		253775391		Translation elongation factor Tu
Thein, 2010	<i>E. coli</i> BL21	Negative		253775395		Glutamate racemase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775405		Phosphoenolpyruvate carboxylase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775430		Heat shock protein HslVU, ATPase subunit HslU
Thein, 2010	<i>E. coli</i> BL21	Negative		253775435		Glycerol kinase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775436		Fructose-1,6-bisphosphatase, class II
Thein, 2010	<i>E. coli</i> BL21	Negative		253775496		Nitrogen metabolism transcriptional regulator, NtrC, Fis Family
Thein, 2010	<i>E. coli</i> BL21	Negative		253775545		5-methyltetrahydropteroyltriglutamate/homocysteine S-methyltransferase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775594		Thioredoxin
Thein, 2010	<i>E. coli</i> BL21	Negative		253775597		ATP-dependent DNA helicase Rep
Thein, 2010	<i>E. coli</i> BL21	Negative		253775605		Acetolactate synthase, large subunit, biosynthetic type
Thein, 2010	<i>E. coli</i> BL21	Negative		253775621		Aspartate/ammonia ligase
Thein, 2010	<i>E. coli</i> BL21	Negative		253775657		Tryptophanase
Yu, 2012	<i>C. thermocellum</i>	Positive		gi 125975384		50S ribosomal protein L3

Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y722		lmo1504	Alanyl-tRNA synthetase (alaS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66699		lmo2606	RNA polymerase (alpha subunit) (rpoA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAA4		lmo0249	50S ribosomal protein L1 (rplA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66330		lmo2633	30S ribosomal protein S10 (rpsJ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5W7		lmo1938	ribosomal protein S1 like protein
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66372		lmo2656	30S ribosomal protein S12 (rpsL)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q9RQI6		lmo2468	ATP-dependent Clp protease proteolytic subunit (clpP)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66611		lmo2655	30S ribosomal protein S7 (rpsG)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q9RLT9		lmo0258	RNA polymerase (beta subunit) (rpoB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y709		lmo1519	Aspartyl-tRNA synthetase (aspS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66042		lmo0250	50S ribosomal protein L10 (rplJ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6C5		lmo1765	Bifunctional phosphoribosylaminoimidazole carboxy formyl formyltransferase and inosine-monophosphate cyclohydrolase (purH)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6V2		lmo1579	Alanine dehydrogenase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6D3		lmo1754	Glutamyl-tRNA(Gln) amidotransferase (subunit B) (gatB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7Y1		lmo1138	ATP-dependent Clp protease proteolytic component
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7F6		lmo1325	Translation initiation factor IF-2 (infB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66054		lmo0248	50S ribosomal protein L11 (rplK)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	O53083		lmo1787	50S ribosomal protein L19 (rplS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4I3		lmo2457	Triose phosphate isomerase (tpi)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7J7		lmo1280	GTP-sensing transcriptional pleiotropic repressor CodY
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7F1		lmo1331	Polynucleotide phosphorylase (PNPase) (pnpA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6D2		lmo1755	Glutamyl-tRNA(Gln) amidotransferase (subunit A) (gatA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y8I9		lmo0913	Succinate semialdehyde dehydrogenase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q92AU6		lmo1711	Aminopeptidases
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q927L9		lmo2620	50S ribosomal protein L5 (rplE)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66548		lmo2626	30S ribosomal protein S3 (rpsC)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6T6		lmo1596	30S ribosomal protein S4 (rpsD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66484		lmo2628	30S ribosomal protein S19 (rpsS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y822		lmo1096	GMP synthetase (guaA)

Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAB3		lmo0237	Glutamyl-tRNA synthetase (gltX)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y766		lmo1435	Dihydrodipicolinate synthase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y665		lmo1835	Carbamoyl-phosphate synthetase (catalytic subunit) (pyrAB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y971		lmo0662	Phosphomethylpyrimidine kinase thiD (thiD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y450		lmo2605	50S ribosomal protein L17 (rplQ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4G8		lmo2475	Phosphomannomutase and phosphoglucomutase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6R4		lmo1620	Xaa-His dipeptidase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y710		lmo1299	Glutamine synthetases (glnA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6V0		lmo1581	Acetate kinase (ackA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y583		lmo2188	Oligoendopeptidase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7K9		lmo1268	ATP-dependent Clp protease ATP-binding subunit ClpX (clpX)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6B1		lmo1780	Aminotripeptidase (peptidase T)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6B8		lmo1773	Adenylosuccinate lyase (purB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5B2		lmo2155	Ribonucleoside-diphosphate reductase, subunit alpha
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6X9		lmo1552	Valyl-tRNA synthetase (valS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAB8		lmo0228	Lysyl-tRNA synthetase (lysS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P0A3L1		lmo1785	Translation initiation factor IF-3 (infC)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y915		lmo0727	L-glutamine-D-fructose-6-phosphate amidotransferase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y8A1		lmo1011	Tetrahydrodipicolinate succinylase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y789		lmo1403	DNA mismatch repair (recognition) (mutS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6N9		lmo1645	ATP-dependent dsDNA exonuclease SbcC
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66383		lmo2608	30S ribosomal protein S13 (rpsM)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAW1		lmo0002	DNA polymerase III, beta chain (dnaN)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66103		lmo1783	50S ribosomal protein L20 (rplT)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y493		lmo2561	Arginyl-tRNA synthetase (argS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y423		lmo2652	Transcriptional antiterminator
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7Q1		lmo1222	Phenylalanyl-tRNA synthetase beta subunit (pheT)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y714		lmo1293	Glycerol 3-phosphate dehydrogenase (glpD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y447		lmo2613	50S ribosomal protein L15 (rplO)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5N8		lmo2019	Isoleucyl-tRNA synthetase (ileS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7B3		lmo1373	Branched-chain alpha-keto acid dehydrogenase E1 subunit (2-oxoisovalerate dehydrogenase beta subunit)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6T4		lmo1598	Tyrosyl-tRNA synthetase (tyrS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P58695		lmo1896	Asparaginyl-tRNA synthetases (ansB)

Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7F9		lmo1322	N utilization substance protein A (NusA protein) (nusA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6X2		lmo1559	Threonyl-tRNA synthetase (thrS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6Q0		lmo1634	Alcohol-acetaldehyde dehydrogenase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4H1		lmo2471	NADH oxidase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66461		lmo0046	30S ribosomal protein S18 (rpsR)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAR1		lmo0055	Adenylosuccinate synthetase (purA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y764		lmo1437	Aspartate-semialdehyde dehydrogenase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4I4		lmo2456	Phosphoglycerate mutase (pgm)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAR9		lmo0044	30S ribosomal protein S6 (rpsF)

Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4F5		lmo2489	Excinuclease ABC (subunit B) (uvrB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y3W1		lmo2720	Acetate-CoA ligase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P60384		lmo2072	REX_LISMO Redox-sensing transcriptional repressor
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7G2		lmo1319	Prolyl-tRNA synthetase (proS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y689		lmo1808	Malonyl CoA-acyl carrier protein transacylase (fabD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6X8		lmo1553	Glutamate-1-semialdehyde 2,1-aminotransferases (hemL)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P66623		lmo2618	30S ribosomal protein S8 (rpsH)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P0DJM1		lmo1472	Heat shock protein DnaJ (dnaJ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y690		lmo1807	3-ketoacyl-acyl carrier protein reductase (fabG)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y730		lmo1493	Oligopeptidase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y838		lmo1080	Similar to <i>B. subtilis</i> minor teichoic acids biosynthesis protein GgaB
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4B2		lmo2539	Glycine hydroxymethyltransferase (glyA)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5E6		lmo2118	Phosphoglucomutase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q927L7		lmo2622	50S ribosomal protein L14 (rplN)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y664		lmo1836	Carbamoyl-phosphate synthetase (glutaminase subunit) (pyrAa)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y8A5		lmo1005	3-hydroxyisobutyrate dehydrogenase ( <i>B. subtilis</i> YkwC protein)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAB1		lmo0239	Cysteinyl-tRNA synthetase (cysS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q927L2		lmo2627	50S ribosomal protein L22 (rplV)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7C7		lmo1357	Acetyl-CoA carboxylase subunit (biotin carboxylase subunit)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6W5		lmo1566	Isocitrate dehydrogenases (citC)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6J6		lmo1688	Glucose 1-dehydrogenase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y606		lmo1897	Aspartate aminotransferases (aspB)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	P61055		lmo2631	50S ribosomal protein L4 (rplD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y708		lmo1520	Histidyl-tRNA synthetase (hisS)

Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y825		lmo1093	NH(3)-dependent NAD(+) synthetases, nitrogen regulatory protein
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5L9		lmo2038	UDP-N-acetylmuramoylalanyl-D-glutamate-2,6-diaminopimelate ligase (murE)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8YAR2		lmo0053	50S ribosomal protein L9 (rplI)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q48793		lmo0199	Phosphoribosyl pyrophosphate synthetase (prs)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q9ZEY0		lmo0265	Succinyldiaminopimelate desuccinylase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y964		lmo0669	Oxidoreductase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y8R6		lmo0829	Pyruvate-flavodoxin oxidoreductase (nifJ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y837		lmo1081	Glucose-1-phosphate thymidyl transferase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y7Q2		lmo1221	Phenylalanyl-tRNA synthetase alpha subunit (pheS)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6T0		lmo1603	Aminopeptidase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y6C1		lmo1769	Phosphoribosylformylglycinamide synthetase I (purQ)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5V7		lmo1948	Two-component response regulator (ResD) (resD)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5S0		lmo1986	Ketol-acid reductoisomerase (acetohydroxy-acid isomeroreductase) (ilvC)
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y5Q1		lmo2005	Oxidoreductase
Portillo, 2011	<i>L. monocytogenes</i>	Positive	Q8Y4U2		lmo2340	Similar to <i>Erwinia chrysanthemi</i> IndA protein
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8YAD0		Lmo0214	mfd, transcription-repair coupling factor
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8YAC3		Lmo0223	cysK, cysteine synthase
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y862		Lmo1055	pdhD, dihydrolipoamide dehydrogenase, E3 subunit of pyruvate dehydrogenase complex
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y7G7		Lmo1314	fir, ribosome recycling factors
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	P0DJM2		Lmo1473	dnaK, class I heat-shock protein (molecular chaperone) DnaK
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y6Q0		Lmo1634	Alcohol-acetaldehyde dehydrogenase
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y6M7		Lmo1657	tsf, translation elongation factor
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q9AGE6		Lmo2068	groEL, class I heat-shock protein (chaperonin) GroEL
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y4L2		Lmo2425	Glycine cleavage system protein H
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	P64074		Lmo2455	eno, enolase
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y4I4		Lmo2456	pgm, phosphoglycerate mutase
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y4I2		Lmo2458	pgk, phosphoglycerate kinase

2004						
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y4I1		Lmo2459	Glyceraldehyde-3-phosphate dehydrogenase
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y498		Lmo2556	fbaA, fructose-1,6-bisphosphate aldolase type II
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y422		Lmo2653	tufA, translation elongation factor EF-Tu
Schaumburg, 2004	<i>L. monocytogenes</i>	Positive	Q8Y421		Lmo2654	fus, translation elongation factor G

Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253753990	SSU1283	Xaa-His dipeptidase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253753997	SSU1290	Phosphoglucosamine mutase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754027	SSU1320	Enolase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754034	SSU1327	DNA gyrase subunit B
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754055	SSU1348	50S ribosomal protein L31
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754073	SSU1366	ATP-dependent Clp protease proteolytic subunit
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754074	SSU1367	Uracil phosphoribosyltransferase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754102	SSU1396	ADP-ribose pyrophosphatase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754137	SSU1433	UDP-N-acetylglucosamine 1-carboxyvinyltransferase 2
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754139	SSU1435	S-adenosylmethionine synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754145	SSU1441	DNA polymerase III subunit gamma/tau
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754153	SSU1451	Phosphoglyceromutase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754160	SSU1458	DNA-binding protein HU

Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754169	SSU1467	Exodeoxyribonuclease VII large subunit
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754176	SSU1478	Manganese-dependent inorganic pyrophosphatase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754177	SSU1479	Oligopeptidase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754184	SSU1486	NH(3)-dependent NAD(+) synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754211	SSU1513	Tyrosine recombinase XerD
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754217	SSU1519	Pyridoxal-dependent decarboxylase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754218	SSU1520	Aminopeptidase C
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754224	SSU1526	Transcription elongation factor
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754232	SSU1534	GTP-binding protein EngA
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754238	SSU1541	6-phosphogluconate dehydrogenase, decarboxylating
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754267	SSU1570	Glycyl-tRNA synthetase beta chain
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754284	SSU1587	Seryl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754293	SSU1598	Acetyl-coenzyme A carboxylase carboxyl transferase subunit beta
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754294	SSU1599	Biotin carboxylase subunit of acetyl-CoA carboxylase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754296	SSU1601	Biotin carboxyl carrier protein of acetyl-CoA carboxylase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754297	SSU1602	3-oxoacyl-[acyl-carrier-protein] synthase II
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754298	SSU1603	3-oxoacyl-[acyl-carrier protein] reductase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754300	SSU1605	Enoyl-ACP reductase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754301	SSU1606	Acyl carrier protein (ACP)
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754306	SSU1611	Aspartate kinase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754318	SSU1623	Elongation factor P (EF-P)
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754319	SSU1624	Metallopeptidase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754320	SSU1625	UvrABC system protein A (UvrA protein)
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754324	SSU1629	Single strand binding protein
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754325	ssu1630	30S ribosomal protein S6
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754329	SSU1634	Dihydrolipoamide dehydrogenase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754330	SSU1635	Dihydrolipoamide acetyltransferase component of pyruvate dehydrogenase complex

Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754331	SSU1636	Pyruvate dehydrogenase E1 component, beta subunit
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754332	SSU1637	Pyruvate dehydrogenase E1 component, alpha subunit
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754337	SSU1642	Translation initiation factor IF-2
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754340	SSU1645	N utilization substance protein A
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754371	SSU1679	Threonine dehydratase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754372	SSU1680	Ketol-acid reductoisomerase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754378	SSU1686	Dihydroxy-acid dehydratase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754381	SSU1691	30S ribosomal protein S9
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754382	SSU1692	50S ribosomal protein L13
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754410	SSU1721	Polyribonucleotide nucleotidyltransferase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754415	SSU1728	30S ribosomal protein S15
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754429	SSU1743	Aminopeptidase PepS
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754432	SSU1746	DNA polymerase III PolC-type
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754439	SSU1753	Prolyl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754444	SSU1758	Adenylosuccinate synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754452	SSU1766	Stress response-related Clp ATPase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754456	SSU1770	Elongation factor Ts
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754457	SSU1771	30S ribosomal protein S2
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754490	SSU1804	ssDNA-binding protein
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754501	SSU1815	Glutamyl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754513	SSU1827	Glycerol-3-phosphate dehydrogenase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754518	SSU1832	2,3,4,5-tetrahydropyridine-2,6-dicarboxylate N-succinyltransferase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754522	SSU1836	Glucose-6-phosphate isomerase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754525	SSU1839	Transketolase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754549	SSU1863	Leucyl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754550	SSU1864	Endopeptidase O
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754581	SSU1903	Anaerobic ribonucleoside-triphosphate reductase

Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754588	SSU1910	Arginyl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754601	SSU1923	Aspartyl-tRNA synthetase
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754613	SSU1935	30S ribosomal protein S4
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754626	SSU1948	L-serine dehydratase, beta chain
Gómez-Gascón, 2012	<i>S. suis</i>	Positive		gi 253754638	SSU1960	Inosine-5'-monophosphate dehydrogenase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 1368	Catalase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 1385	Aconitrate hydratase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 1448	2-oxoglutarate dehydrogenase, E2
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 1449	2-oxoglutarate dehydrogenase, E1
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 1838	Phosphoenolpyruvate carboxykinase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 2048	3-isopropylmalate dehydratase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 2049	3-isopropylmalate dehydratase
Hempel, 2011	<i>S. aureus</i>	Positive			SACOL 2154	Arginase
Doro, 2009	<i>S. agalactiae</i>	Positive			SAN_1636	Peptidyl-prolyl cis-trans isomerase, cyclophilin-type
Doro, 2009	<i>S. agalactiae</i>	Positive			SAN_0083	ribosomal protein L2 (rplB)
Doro, 2009	<i>S. agalactiae</i>	Positive			SAN_0854	Translation elongation factor Tu (tuf)
Doro, 2009	<i>S. agalactiae</i>	Positive			SAN_1390	ribosomal protein L10
